

Wyatt Hansen

WyattHansen99@gmail.com • GitHub.com/WyattH99 • LinkedIn.com/in/WyattH99 • WyattH99.github.io • Austin, TX

SKILLS

Programming Languages: C, C++, Python
Embedded Linux: Yocto, OpenBMC, Kernel, Device Tree, Driver and Application Development, LVGL
Microcontroller: STM32 Platform, Bare-Metal / Super-Loop Firmware, GPIO, ADC
Protocols: I2C, SPI, UART, Modbus, BACnet, SNMP, Redfish
Debug & Test: JTAG/SWD, Logic Analyzers, Oscilloscopes, Bench-Validation Scripting, Software Testing
Tools & Certifications: Git, GitHub Actions, Agile / Jira, AI Coding Agents (Claude Code); FreeRTOS, STM32 Driver Development, ARM Cortex-M3/M4 (Udemy)

EXPERIENCE

Embedded Software Engineer II April 2026 – Present
Embedded Software Engineer May 2024 – April 2026
Accelsius Austin, Texas

- Design and develop the full software and firmware stack for two-phase direct-to-chip liquid cooling systems for AI and HPC data centers, contributing across firmware-update, watchdog, and fault-recovery paths on a small team.
- Developed bare-metal system controls on an STM32 Super-Loop architecture — ensuring safe, thermodynamically optimal two-phase cooling — and performed sensor bring-up for temperature, pressure, and level sensors, ADCs, pumps, and continuous control valves, validated with bench-test scripts.
- Own the customer-facing communication stacks — BACnet, Modbus, and SNMP — integrating the systems with building-management and data-center monitoring software.
- Designed communications between the STM32 and ASPEED AST2600, implementing custom parsers and message packets over I2C.
- Built a custom Linux image and services for real-time reporting of 100+ system sensor and fault data points via Redfish, with an LVGL user interface.
- Developed “Snapshot,” a fault-triggered flight recorder that captures every sensor and fault data point for the duration of a fault, giving customers and support retrospective root-cause visibility.
- Led 50+ client and investor demonstrations across three product lines, translating complex embedded architectures for technical and executive audiences.

IT Administrator and Operations Manager March 2020 – April 2024
dkCrew, LLC Splendora, Texas

- Maintained the organization's IT environment, supported users, ensured data security, and drove strategic planning and execution of IT initiatives.

Engineering Intern Summers 2017, 2020, 2021 & Winter 2020
Genesis Dimensions Houston, Texas

- Supported Research and Development for a large-scale 3D printing project utilizing industrial robots and novel materials developed by in-house material scientists.
- Implemented Taiga, an open-source Agile tool, on on-premises servers, and assisted in integrating industrial control panels for a Kuka Robot and a Material Flow Control System.

Engineering Intern August 2018 – June 2021
Arrington Automation Houston, Texas

- Collaborated with a team of engineers to contribute to the design, testing, manufacturing, and integration processes of industrial control panels and control systems.

PROJECTS

Countries of the World Game — [countriesofthe.world](#) 2026

- Designed and launched a real-time multiplayer geography game — React, TypeScript, WebGL2 map renderer, Node backend with Server-Sent Events, Postgres leaderboards — running in production on DigitalOcean behind Cloudflare.
- Developed end to end by directing AI coding agents (Claude Code): owned product direction, feature specification, architecture decisions, code review, and release testing on real devices.

EDUCATION

Master of Science in Engineering (MSE), Software Engineering September 2025 – Present
The University of Texas at Austin
Coursework: Parallel Algorithms, Software Testing, Cloud-Native Application Development, Scalable & Statistical Machine Learning

Bachelor of Science in Computer Engineering & Minor in Cyber Security December 2021
Texas A&M University College Station, Texas
